# **What Are We Going To Talk About?**

**Computer Vision**

**Object Detection**

**Machine Learning**

The Haar wavelet's mother wavelet function  $\psi(t)$  can be described as

$$\psi(t) = \begin{cases} 1 & 0 \leq t < \frac{1}{2}, \\ -1 & \frac{1}{2} \leq t < 1, \\ 0 & \text{otherwise.} \end{cases}$$

Its scaling function  $\phi(t)$  can be described as

$$\phi(t) = \begin{cases} 1 & 0 \leq t < 1, \\ 0 & \text{otherwise.} \end{cases}$$

# Some Background

**Computer vision** tasks include methods for acquiring, processing, analyzing and understanding digital images, and in general, deal with the extraction of high-dimensional data from the real world in order to produce numerical or symbolic information, e.g., in the forms of decisions.

# Some Background

6

**Machine learning** is a type of artificial intelligence (AI) that provides computers with the ability to learn without being explicitly programmed. **Machine learning** focuses on the development of computer programs that can teach themselves to grow and change when exposed to new data.

# Applications

What is ML good for?

# **Why?**

**Crazy Powerful**  
**Challenging**  
**Untapped**  
**Under Represented**

A close-up photograph of a golden-colored hammer. The hammer has a traditional claw head and a straight handle. The head is highly reflective, showing bright highlights and deep shadows, giving it a metallic and polished appearance. The handle is made of a textured metal, possibly brass or copper, with some wear and a slightly irregular shape. The background is dark and out of focus, making the golden hammer stand out.

OpenCV

# OpenCV

[Http://Opencv.Org](http://Opencv.Org)

Like a series of waterfalls, the OpenCV cascade breaks the problem of detecting faces into multiple stages. For each block, it does a very rough and quick test. If that passes, it does a slightly more detailed test, and so on. The algorithm may have 30-50 of these stages or cascades, and it will only detect a face if all stages pass. The advantage is that the majority of the pictures will return negative during the first few stages, which means the algorithm won't waste time testing all 6,000 features on it. Instead of taking hours, face detection can now be done in real time.
